The story so far

Dogger Bank Offshore Wind Farms were developed over a five year period by Forewind, with Development Consent Orders (DCOs) being granted for these Nationally Significant Infrastructure Projects in 2015.

Dogger Bank Wind Farms present a key opportunity for both joint venture partners to increase their stake in the offshore wind market. Already experienced offshore developers, the JV partners bring a wealth of experience from working in the space for well over a decade.

A closer look at Dogger Bank

Dogger Bank sits as an isolated topographic high within the central to southern North Sea spanning UK, German, Danish and Dutch waters. The project will be built within the UK portion.

The remains of mammals and evidence of human activity and vegetation suggest it was a land mass connecting the UK to mainland Europe - known as Doggerland. As the sea level rose after the last ice age, it gradually became an island until it was completely covered by water between 8000 and 5500 years ago.

The Dogger Bank Zone, located between 125 and 290km off the east coast of Yorkshire, extends over approximately 8660km². Water depth ranges from 18m to 63m.
